

NATUROFLOOR

Cleaning and care instructions

Durable beauty.

You chose Naturofloor®, the premium hand-crafted designer covering for surfaces that are truly appealing. The best way for Naturofloor® to retain its original beauty is through proper and thorough care, just like all decorative materials. This set of instructions answers your questions about cleaning and caring for your Naturofloor® surfaces

Preventive measures

The use of a clean zone (mat) in the entrance area is recommended and catches 85% of all moisture and dirt brought inside. Putting felt pads on chairs, tables, bar stools, sofas, chairs, vases and other decorative objects protects the floor.

Cleaning agents

Do not use any cleaning agents containing floor polish additives. They inevitably cause streaking and an unattractive greasy look. Stay completely away from heavily alkaline, caustic, solvent-containing or alcohol-containing products! Use strong cleaning and decalcifying agents only in diluted form (ratio of 1 to 10). Avoid granular agents; they damage the seal after a certain amount of time.

Easy to care for

It suffices to clean the floors and walls with clean water and a microfibre cloth. ENJO products have proven reliable and are suitable for gently cleaning Naturofloor surfaces. Cleaning agents (based on natural ingredients) need to be used only with heavily soiled surfaces. Wet areas: To reduce lime scale, rinse the coated surfaces with cold water following a shower and dry it with the appropriate fibre. Use a suitable floor squeegee or an ENJO fibre for the shower floor. Employ decalcifying agents sparingly and only in diluted form. Diluted vinegar is an alternative.

Things to keep in mind

Although Naturofloor® allows no liquids to penetrate, any spilled liquids should be wiped up immediately. If water or liquids in general (shower gel, aromatic oils, plant water) do not evaporate and act on the seal over an extended period of time (constantly wet surface), the seal can soften and become spotty. Therefore place feeding bowls and flower pots in an elevated position above the floor so air can circulate. Hair dyes, coffee, curry, saffron, oil, etc. can attack and discolour the seal if left to act on it over an extended period of time.

If the worst comes to the worst

As a rule, most damage, including damage caused by heavy impacts, heat or chemicals, can be eliminated on site. In the process, the coating regains its original smooth and hygienic surface characteristics. Turn to your local Naturofloor® specialist for professional restoration work.
